

Abrasive Blasting Waste Daily Cleanup

Abrasive blasting waste is a mixture of used blasting media, paint particles and other debris produced during the paint removal operation. This waste must be properly collected and stored during and upon completion of the paint removal operation.

Collect all abrasive blasting waste from inside and outside the containment area at the end of each work day. This waste can be collected by vacuum or manually. Do not use air pressure or a water stream that will redistribute the waste material. This can result in greater volumes of waste by spreading contamination. Wetting for dust control is acceptable as long as application of water does not spread contamination.
